

THREADS_TECHNICAL_SPEC.md

Clarity Lab — Threads Discovery Engine

Purpose

Threads is not primarily a distribution channel.

Threads is a research and discovery system.

Its purpose is to identify:

- recurring human tensions
- recurring questions
- language patterns
- emotional patterns
- emerging concerns
- future article opportunities
- future product opportunities

The goal is not follower growth.

The goal is not viral reach.

The goal is not direct lead generation.

Those outcomes are considered secondary.

The primary objective is discovery.

Core System Model

Human Tension ↓ Threads Content ↓ Audience Response ↓ Comment Collection ↓ Theme Analysis ↓
Research Database ↓ Article Recommendations ↓ Clarity Lab Knowledge System

Content Sources

Threads content may be generated from:

Priority Order:

1. Existing Clarity Lab articles
2. Existing Clarity Lab content library

3. Theme database insights
4. Comment analysis findings
5. Recurring audience tensions
6. Trending discussions
7. Administrator-provided topics

The system must never copy article text directly.

It should generate new observations from the same conceptual territory.

Publishing Workflow

Phase 1

Human Approval Required

Workflow:

Draft Generated ↓ Admin Review ↓ Approve / Edit / Reject ↓ Publish

Automatic publishing is disabled.

Phase 2

Optional

Automated publishing may be enabled later.

Not part of initial implementation.

Posting Frequency

Initial frequency:

3 posts per day

Schedule must be configurable.

After sufficient data collection:

- 3 posts/day
- 5 posts/day
- adaptive frequency

The system should support future optimization based on engagement and insight quality.

Do not assume more posts automatically produce better results.

Threads Content Database

Store every generated post.

Fields:

- post_id
- source_type
- source_topic
- category
- opening_type
- generated_text
- generated_at
- approved_by
- published_at
- status

Statuses:

- draft
 - approved
 - scheduled
 - published
 - archived
 - rejected
-

Opening Type Tracking

Every post should be tagged with:

- observation
- contradiction
- question
- relationship moment
- decision point
- realization

Purpose:

Analyze which opening structures create the strongest audience response.

Content Categories

Store category for every post.

Examples:

- work
- decisions
- information
- relationships
- self-understanding
- AI
- identity
- uncertainty

Used later for performance analysis.

Duplicate Detection

Before approval or publication:

Compare generated content against:

- recent published posts
- recent drafts
- recent article-derived content

Perform semantic similarity analysis.

If similarity exceeds threshold:

- regenerate content
- flag for review

Goal:

Prevent repetitive observations and conceptual duplication.

Comment Collection Engine

Collect:

- comments
- replies
- timestamps
- engagement data

Run every 60 minutes.

Store:

- post_id
- comment_id
- comment_text
- author
- timestamp
- engagement metrics

Support future historical analysis.

Weighted Comment Analysis

Not all comments have equal value.

Assign weighting.

Examples:

Short agreement:

"I agree."

Weight: 1

Recognition:

"That's exactly what happened to me."

Weight: 5

Detailed personal experience:

Multiple sentences describing a real situation.

Weight: 10

Long-form responses should influence theme detection more heavily.

Theme Extraction Engine

AI analyzes collected comments.

Identify:

- recurring tensions
- recurring frustrations
- recurring questions
- recurring emotional patterns
- misunderstandings
- emerging concerns

Output:

Theme Report

Example:

Theme: Information Overload

Frequency: 27

Representative Statements:

- I keep learning but still feel behind
- I don't know what matters anymore

Potential Article:

When Learning Becomes Avoiding

Potential Product Insight:

Need for orientation support

Research Database

Create persistent repository.

Store:

- theme
- category
- frequency
- first_seen
- last_seen
- representative_comments
- related_posts
- related_articles

Themes accumulate over time.

This database becomes the institutional memory of Clarity Lab.

Post Performance Database

Track performance separately from themes.

Store:

- post_id
- category
- opening_type
- impressions
- likes
- replies
- reposts
- engagement rate
- comment count

Purpose:

Understand what observations resonate.

Not merely what goes viral.

Pattern Analysis Engine

Generate insights such as:

Highest Performing Categories

Examples:

- decisions
- work
- uncertainty

Highest Performing Opening Types

Examples:

- contradiction
- realization

Lowest Performing Categories

Examples:

- AI
- productivity

The purpose is editorial learning.

Not optimization for reach.

Article Recommendation Engine

When themes exceed threshold:

Suggest article opportunities.

Examples:

Theme: Career Uncertainty

Suggested Articles:

- The Difference Between Uncertainty and Lack of Direction
- Why More Information Doesn't Always Create Better Decisions

The engine suggests.

It does not automatically create articles.

Prompt Evolution Layer

The system should support future prompt adaptation.

Example:

If recurring audience reactions consistently favor:

- uncertainty
- identity shifts
- decisions

The system may recommend updates to content priorities.

Audience behavior should inform future editorial direction.

Prompts should evolve from observed reality.

Not assumptions.

Weekly Insight Report

Generate automatically.

Frequency:

Weekly

Include:

1. Most discussed tensions
2. Fastest growing themes
3. Highest engagement observations
4. Most effective opening types
5. Emerging questions
6. Suggested article topics
7. Suggested research directions
8. Suggested product opportunities

Deliver report to administrator.

Reply Recommendation Engine

Phase 1

Generate reply suggestions only.

Workflow:

Comment ↓ AI Draft Reply ↓ Admin Review ↓ Approve ↓ Publish

Automatic replies disabled.

Analytics Dashboard

Track:

- total posts
- post categories
- opening types
- engagement
- comments

- recurring themes
- theme growth
- article recommendations

Primary KPI:

Meaningful tensions discovered.

Secondary KPI:

Comment quality.

Tertiary KPI:

Content engagement.

Follower count is not a primary success metric.

Strategic Rule

Threads is not a content factory.

Threads is not an audience growth machine.

Threads is not a lead generation funnel.

Threads is a discovery engine.

The system exists to observe how people experience:

- uncertainty
- work
- relationships
- identity
- information
- AI
- decisions
- change

The purpose is to identify recurring structures in human experience and feed those insights back into the Clarity Lab ecosystem.
